

ZINC PLATED FOR CONCRETE

Concrete Screw Anchors are a totally removable, medium duty, rotation setting, thread forming anchor, ideal for either temporary or permanent anchoring into substrates such as concrete, brick, hollow brick or block. The Concrete Screw-Anchor is particularly well suited to close-to-edge or close-to-anchor fixing as it does not expand and burst the surrounding substrate.

ICC Evaluation is for cracked and uncracked concrete substrates.

Zinc Clear Carbon Steel

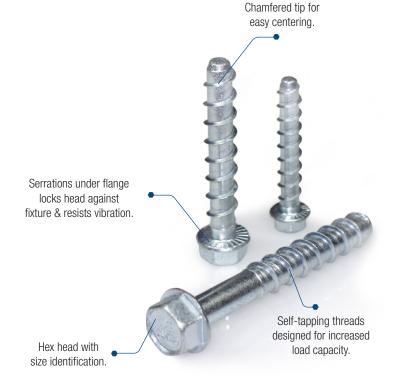

KEY BENEFITS

- Quick installation with a drill and drive method using a hex socket, ratchet or a torque controlled impact wrench.
- Unlike chemical anchoring or sleeved anchors, Concrete Screw-Anchors can be removed with ease leaving the hole clear of debris
- An increase in durability and reliability on installation of the Concrete Screw-Anchors, is a result of the dual-hardened body.
- The large self-tapping thread feature of this bolt is designed for fast advancing and high performance capacity as threads are formed in substrate material on installation.

PHYSICAL PROPERTIES

ZINC PLATED FOR CONCRETE

MATERIAL SPECIFICATIONS

Concrete Screw-Anchors are a fast installation and immediate loading, completely removable anchor. The dual-hardened body and the large diameter self tapping screw by nature makes this anchor ideal for high load applications.

CARBON STEEL

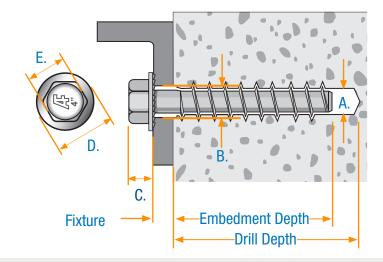

The Carbon Steel Concrete Screw-Anchors material composition consists of 10B21 carbon steel. The anchor's tip is dual hardened for the purpose of threading into concrete.

INSTALLATION SPECIFICATIONS

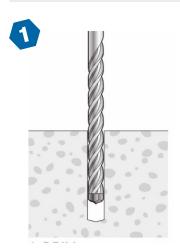

- A. Anchor/Drill Ø, inch.
- B. Clearance hole Ø in fixture, inch (major diameter).
- C. Flanged head height, inch.
- D. Washer Ø, inch.
- E. Wrench size, inch.

Table A1:

1/2	5/8	1/2	1	3/4
5/8	3/4	9/16	1-1/8	15/16

INSTALLATION GUIDE

 Drill a hole into the base material to the required depth using a drill bit that meets the requirements of ANSI B212.15.

2. Remove Dust and debris from the hole using a hand pump or compressed air.

 Select a powered impact wrench or torque wrench, attach an appropriate sized hex socket to the wrench and mount the screw anchor head into the socket.

4. Drive the anchor through the fixture into the hole until the head of the anchor comes into contact with the fixture.

SETTING

BASE MATERIAL THICKNESS

When setting an anchor, there is a recommended minimum thickness of the solid base material. The minimum is based on 1.5 times of the calculated embedment to be used. Eg. an anchor to be installed to a depth of 4", the base material should be 6" deep.

Embedment - a pre-determined depth to obtain the required load capacity. Equal to or greater than the minimum embedment allowance.

Drill Depth - is the required embedment depth into the substrate plus a cavity allowance approximately 1.5 times the anchor diameter.

SPACING

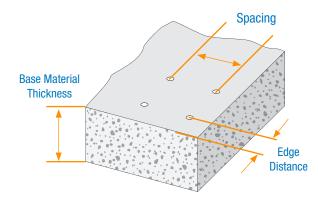

Anchor spacing should be determined by 10 times the selected anchor diameter to obtain the maximum load in tension or shear. This spacing can be reduced but the load value should also be reduced. The recommended minimum spacing is 5 times the selected anchor diameter, which will have a load rating reduced to 50%.

EDGE DISTANCE

Shall be determined by 10 times the selected anchor diameter to obtain the maximum load in tension or shear. The recommended minimum edge distance is 3 times the selected anchor diameter.

In tension – reducing the edge distance to the minimum, the load value will reduce by 30%.

In shear – reducing the edge distance to the minimum, the load value will reduce by 85%.
